Problem 10

Start:

Input: Three integers, A, B, K ~~if~~ A ≤ B and all are ~~positive~~ integers

Process: Create variables start = A and stop = B+1 and count = 0

Process: For each integer in range start to stop:
if the integer is divisible by K:
Add 1 to count

return

Problem 10 Try 2

Input: same as before

Process: create variable mult_before_A and mult_before_B
↳ Mult_Before_A = all multiples of K before A (exclusive)
↳ A divided by K, rounded down
↳ Mult_Before_B = all multiples of K before B (conclusive)
↳ B divided by K, rounded down

Process: mult_Before_A minus mult_Before_B := Mult_AB
return

Output: Mult_AB
